## Key insights:

### Positive change in customer engagement.

Over the course of our analysis, we were able to determine that engagement has greatly increased (+23.34%) for the customers that received a promotional email, successfully encouraging them to make a purchase on our online store.

### Positive change in customer sales.

Average sales were moderately higher (+8.53%) for Sent Participants than control group. The estimated increase in purchase amount is \$855.

### Sales have slowed down drastically on the last day - 14th February 2024.

This is an expected behavior, as we are considering online store purchases, which will need to be delivered to the recipients. Assuming that our target audience was couples, they will want to have gifts prepared before the day itself. Nonetheless, it does negatively impact all the KPIs that we have measured.

### Most common purchase amount for targeted customers was between \$100-\$125.

In contrast, there was no noticeable 'favored' spending bracket for the control group. It is unknown what could have triggered this spending behavior in the targeted group - an assumption could be made that some element of the Marketing Campaign has caused it e.g. purchases above \$100 were given free delivery or a special discount. Unfortunately we were not provided with the specifics of the Marketing Campaign (i.e. what kind of incentives were used) and we cannot make those conclusions.

## Recommendations:

### 1. For next marketing campaign, lower the Control Group from 30% to 20%.

20% is a safe proportion for a control group when targeting smaller audiences (up to 2,000). This way we can target more of the audience with our campaign and even further increase the profit from it.

(Source: <https://www.optimize.com/resources/learning-center/control-groups-in-marketing>)

### 2. Focus on the sales volume in the next marketing campaign.

While the increase in engagement was great (+23.34%), the average increase in sales was only moderate (+8.53%). As both of those KPIs act multiplicatively for the general profit, it is best to focus our efforts on the one that increased slower.

### 3. Find a target audience for the finish of the marketing campaign.

Our sales slowed down drastically on the 14th February, which could have been expected, given that gifts need to be prepared in advance. While the couples are busy celebrating Valentine's Day, could there be another audience that we could target for an impulse, last-minute purchase? How about 'Valentine's Day for Singles'?

Alternative approach: While this will not provide any real business or customer benefit, we could exclude the 14th February from the KPI calculations in order to improve the optics, when presented to the investors and other stakeholders.
